Amendments to the Claims:

1. (currently amended)   A method for reducing a blocking artifact in a video stream, the method comprising:

5   calculating an activity value representing local activity around a block boundary between a plurality of adjacent blocks in the video stream;

          determining a region mode for the block boundary according to the activity value; and

10

          selecting one of a plurality of filters to filter a plurality of pixels around the block boundary to reduce the blocking artifact according to the region mode;

          wherein at least one of the filters is a one dimensional filter formed by using a

15   4-point Hadamard Transform (HT); and

          wherein if at least one of the adjacent blocks is an intra-coded block:

                    if the region mode is an active region and a high frequency component

20   c_3 is less than a fourth threshold, filtering the pixels around the block boundary using the one dimensional filter formed by using the 4-point Hadamard Transform (HT); and

                    if none of the adjacent blocks are intra-coded blocks:

25

                    if the region mode is an active region and the high frequency component c_3 is less than a sixth threshold, filtering the pixels around the block boundary using the one dimensional filter formed by using the 4-point

Hadamard Transform (HT).

2. (canceled)

5   3. (currently amended)   The method of <u>claim 1</u> ~~claim 2~~, wherein the high frequency component c_3 is calculated using pixels v_6, v_7, v_8, v_9 around the block boundary as follows:

$$c_3 = (v_6-v_7+v_8-v_9)/2.$$

10   4. (original)   The method of claim 3, wherein the high frequency coefficient c_3 of the HT is reduced to 0 for frame-coded pictures.

5. (original)   The method of claim 3, wherein the high frequency coefficient c_3 of the HT is reduced to one half for field-coded pictures.

15

6. (currently amended)   The method of <u>claim 1</u> ~~claim 2~~, further comprising adaptively determining a first, a third, the fourth, a fifth, the sixth, and a seventh threshold by at least taking into account differences in quantization parameters QPs of the adjacent blocks.

20

7. (original)   The method of claim 6, further taking into account a user defined offset (UDO) allowing the threshold levels to be adjusted according to the UDO value.

8. (currently amended)   The method of <u>claim 1</u> ~~claim 2~~, further comprising calculating

25   the activity value computed as a sum of absolute differences between pixels V_1 around the block boundary as follows:

$$ACTIVITY = \sum_{I=4}^{6} \left| v_I - v_{I+1} \right| + \sum_{I=8}^{10} \left| v_I - v_{I+1} \right|$$

9. (currently amended)   The method of <u>claim 1</u> ~~claim 2~~, wherein:

5   if at least one of the adjacent blocks is an intra-coded block:

           if the activity value is greater than a first threshold, determining the region
           mode to be an active region;
           if the activity value is less than the first threshold but greater than a second
10   threshold, determining the region mode to be a smooth region; and

           if the activity value is less than the second threshold, determining the region
           mode to be a dormant region; and

15   if none of the adjacent blocks are intra-coded blocks:

           if the activity value is greater than a third threshold, determining the region
           mode to be an active region;

20   if the activity value is less than the third threshold but greater than the second
           threshold, determining the region mode to be a smooth region; and

           if the activity value is less than the second threshold, determining the region
           mode to be a dormant region.

25

10. (original)   The method of claim 9, wherein the second threshold is fixed at a
           predetermined value.

11. (original)   The method of claim 10, wherein the predetermined value is 6.

12. (original)   The method of claim 9, further comprising:

5   if at least one of the adjacent blocks is an intra-coded block:

               if the region mode is smooth region,

                    if the absolute value of the difference of the pixel values on either side of

                    the block boundary is less than a fifth threshold, filtering the pixels

10   around the block boundary according to the filtering range using a second

                    filter; and

               if the region mode is dormant region,

                    if the absolute value of the difference of the pixel values on either side of

15   the block boundary is less than the fifth threshold, filtering the pixels

                    around the block boundary according to the filtering range using a third

                    filter; and

          if none of the adjacent blocks are intra-coded blocks:

20

               if the region mode is smooth region,

                    if the absolute value of the difference of the pixel values on either side of

                    the block boundary is less than a seventh threshold, filtering the pixels

                    around the block boundary according to the filtering range using a second

25   filter; and

               if the region mode is dormant region,

                    if the absolute value of the difference of the pixel values on either side of

the block boundary is less than the seventh threshold, filtering the pixels around the block boundary according to the filtering range using a third filter.

5   13. (original)   The method of claim 12, wherein the filtered pixels are further refined by adjusting a pixel quantized with a larger QP to have more change in value than a pixel quantized with a smaller QP.

14. (original)   The method of claim 13, wherein a first weighting value WT1 and a
10   second weighting value WT2 are used for adjusting the filtered pixels and are obtained from a first quantization parameter QP1 of a first adjacent block and a second quantization parameter QP2 of a second adjacent block as follows:

$$WT1 = \frac{QP1}{QP1 + QP2} \, , \quad WT2 = \frac{QP2}{QP1 + QP2}$$

15

15. (original)   The method of claim 12, wherein if quantization parameters (QPs) of the adjacent blocks are the same, the symmetric second and third filters are used to filter the pixels around the block boundary for smooth and dormant region modes, respectively; and
20

if the QPs of the adjacent blocks are not the same, the asymmetric second and third filters are used to filter the pixels around the block boundary for smooth and dormant region modes, respectively.

25   16. (original)   The method of claim 15, further comprising:

when the region mode is smooth region and the QPs of the adjacent blocks are the

same, filtering the pixels around the block boundary with an N-tap symmetric second filter;

5 when the region mode is smooth region and the QPs of the adjacent blocks are not the same, filtering the pixels around the block boundary with an M-tap asymmetric second filter;

when the region mode is dormant region and the QPs of the adjacent blocks are the same, filtering the pixels around the block boundary with a K-tap symmetric third

10 filter; and

when the region mode is dormant region and the QPs of the adjacent blocks are not the same, filtering the pixels around the block boundary with an L-tap asymmetric third filter.

15

17. (original) The method of claim 16, wherein:

N=5 and the symmetric second filter is [1 3 8 3 1]/16;

20 M=5 and the asymmetric second filter is [1 2 8 3 2]/16 and [2 3 8 2 1]/16;

K=5 and the symmetric third filter is [1 2 2 2 1]/8; and

L=5 and the asymmetric third filter is [1 1 2 2 2]/8 and [2 2 2 1 1]/8.

25

18. (currently amended) The method of claim 1 ~~claim 2~~, wherein filtering the pixels around the block boundary comprises first filtering the pixels at the block boundary and next filtering pixels not adjacent to the pixels at the block boundary.

19. (currently amended) The method of <u>claim 1</u> ~~claim 2~~, further comprising if the video stream comprises interlaced video, performing an interpolation operation to estimate pixel values in an interlaced field before filtering the pixels around the block

5   boundary.

20. (currently amended) The method of <u>claim 1</u> ~~claim 2~~, further comprising determining a filtering range according to block coding types of a plurality of adjacent blocks in the video stream, wherein the filtering range specifies a number of pixels to filter

10   around the block boundary.

21. (original)   The method of claim 20, wherein according to the block coding types of the adjacent blocks in the video stream, the filtering range is determined to be up to eight pixels around the block boundary.

15

22. (original)   The method of claim 20, wherein determining the filtering range according to the block coding types of the adjacent blocks in the video stream further comprises:

20   if at least one of the adjacent blocks is an intra-coded block, determining the filtering range to be up to four pixels around the block boundary; and

        if none of the adjacent blocks are intra-coded blocks, determining the filtering range to be up to eight pixels around the block boundary.

25

23. (original)   The method of claim 1, wherein the video stream is an MPEG video stream.
